

Business Cycle Index 2-4-2016:

The BCI at 196.9 is up from last week's 195.9, and is below the previous peak of this Business Cycle indicated by BCIp now at 93.1. However, the 6-month smoothed annualized growth BCIG at 8.9 is lower than last week's 9.2.

No recession is signaled.

Summary 2-5-2016:

The MAC-US is out of the market, so is the 3-mo Hi-Lo Index of the S&P500, and the MAC-AU also remains out of the markets. The recession indicators COMP and iM-BCIG do not signal a recession. The bond market model avoids high beta (long) bonds, the yield spread is trending downwards. The gold model is in cash and the silver model is invested.

Stock-market:

The IBH-model has been discontinued

The [MAC-US](#) model generated a sell-signal early January and is not invested in the stock-markets. The buy-spread continues to decline and is below last week's level. The next buy signal will emerge once the buy-spread (green graph) moves above the zero line.

The [3-mo Hi-Lo Index](#) of the S&P500 signaled an exit from the stock markets on 12/17/2015 as the 40-day moving average (MA40) moved below the 5% threshold. The MA40 continues to decline.

The MAC-AU model generated a sell signal end of August and thus in cash. The buy-spread is below last week's level. The next buy signal will emerge once the buy-spread (green graph) moves above the zero line. This model and its application is described in [MAC-Australia: A Moving Average Crossover System for Superannuation Asset Allocations](#)

Recession:

Fig. 3 shows the COMP is below last week's revised level, and does not signaling a recession. COMP can be used for stock market exit timing as discussed in this article [The Use of Recession Indicators in Stock Market Timing](#).

Fig. 3.1 shows recession indicator iM-BCIG lower than last week's level. An imminent recession is not signaled.

Fig 3.2: The Forward Rate Ratio between the 2-year and 10-year U.S. Treasury yields (FRR2-10) is near last week's level and far away from signaling a recession.

A description of this indicator can be [found here](#).

Bond-market:

The [BVR-model](#) avoids high beta bonds (long-bonds) and also intermediate duration bonds. The Bond Value Ratio is shown in Fig 4. The BVR is higher than last week's level. According to the model, only when BVR turns upward after having been lower than the lower offset-line should one consider long bonds again. It would appear that [BVR has peaked](#) end of January 2015.

The Yield Curve:

The [yield curve model](#) indicates the trend of the 10-year and 2-year Treasuries yield spread. Figure 5 charts (i10 – i2) and it would appear that the spread has formed a trough and was rising and now the general trend is indeterminate. FLAT and STPP are ETNs. STPP profits from a steepening yield curve and FLAT increases in value when the yield curve flattens. This model confirms the direction of the BVR.

Gold:

The modified Coppock Gold indicator is shown in Fig 6. This model now out of the market. This indicator is described in [Is it Time to Buy Gold Again? - Wait for the buy signal](#)

Silver:

The modified Coppock Silver indicator shown in Fig 7 and is currently invested. This indicator is described in [Silver - Better Than Gold: A Modified Coppock Indicator for Silver.](#)

Monthly Update Summary 2-5-2015: (next update 3/4/2016)

Unemployment

The unemployment rate recession model ([article link](#)), has been updated with the January UER of 4.9%. Based on the historic patterns of the unemployment rate indicators prior to recessions one can reasonably conclude that the U.S. economy is not likely to go into recession anytime soon.

Coppock Indicator for the S&P500

The Coppock indicator for the S&P500 generated the last interim buy signal on January 31, 2014 and a sell signal early in January 2015. This model is now out of the market. This indicator is described [here](#) .

Trade Weighted USD

The TW\$ after an interim decline is recovering and the 6 month moving average trend remains upward.

TIAA Real Estate Account

As of end of December 2015 the 1-year rolling return is 7.12%. The Vanguard REIT Index Fund has retreated from the all-time high; however, the good positive returns of TIAA Real Estate Account are expected to continue. A sell signal is not imminent.

Figure 3.2: Forward Rate Ratio FRR2-10 - leads to Recessions

updated to 02/04/2016
EMA of FRR2-10 = 1.15

FRR2-10 is the ratio of the rate at which one can lock in borrowing for the eight year period starting two years from now, and the ten-year rate itself.

The FRR2-10 is indicative of the slope of the yield curve between the two-year and the ten-year note yields; a FRR2-10 greater than 1.00 indicates a positively sloped yield curve (ten-year note yields are higher than two-year note yields); a FRR2-10 less than 1.00 indicates an inversion of the yield curve (two-year note yields are higher than ten-year note yields).

The last seven recessions were all preceded by a FRR2-10 less than 1.0

| Recessions start | Recessions end | Date when EMA of FRR2-10 less than 1.0 | Lead to Ression start (weeks) | Lead to Ression start (years) |
|------------------|----------------|--|-------------------------------|-------------------------------|
| Jan-70 | Nov-70 | 5/1/68 | 87 | 1.68 |
| Dec-73 | Mar-75 | 3/6/73 | 39 | 0.75 |
| Feb-80 | Jul-80 | 10/9/78 | 69 | 1.32 |
| Aug-81 | Nov-82 | 11/3/80 | 39 | 0.75 |
| Aug-90 | Mar-91 | 2/22/89 | 75 | 1.44 |
| Apr-01 | Nov-01 | 3/17/00 | 54 | 1.05 |
| Jan-08 | Jun-09 | 8/29/06 | 70 | 1.35 |
